

Ch 2 Momentum

Physical Science 115

Why are the engines of a supertanker normally cut off 25 km from port?

Momentum

- Momentum is inertia in motion.
- Momentum = mass x velocity

- Example: How much momentum does a 2 kg object have that is moving at 6m/s?

$$\text{momentum} = (2\text{kg})(6\text{m/s}) = 12\text{kg m/s}$$

The bullet has large momentum because it has large speed.

The supertanker has large momentum because it has large mass.

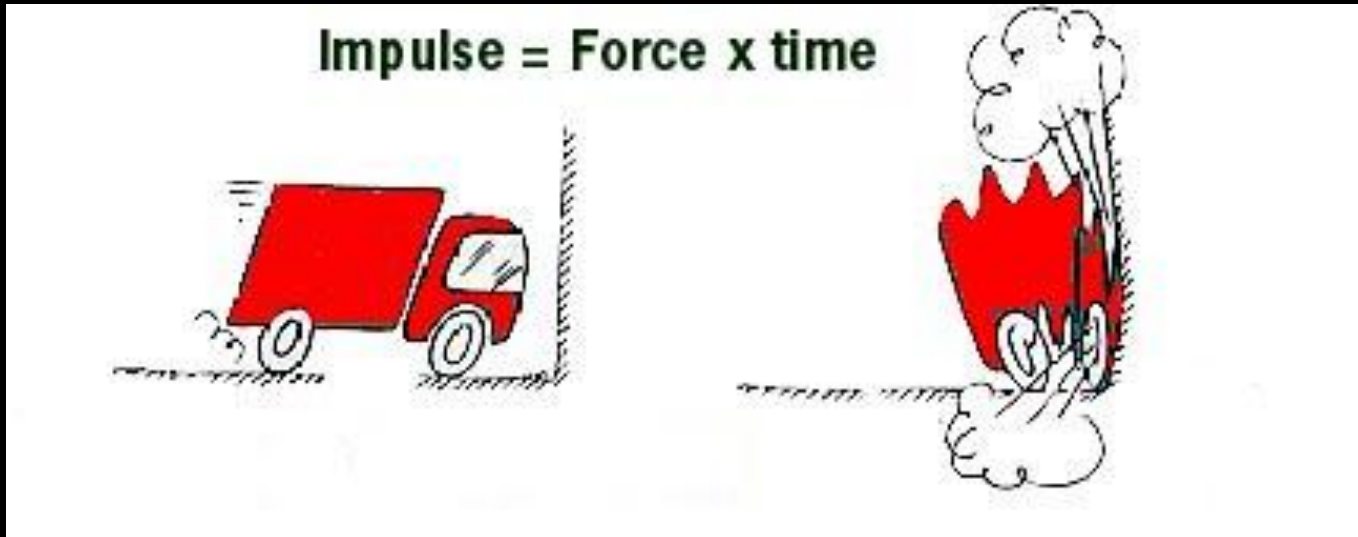

Impulse: How do you change the momentum of something?

- Apply a force.
- But the time over which the force acts, is also important.

(If trying to get a broken down car moving, and you push tremendously but only for a split-second, it won't move. You need to exert the force for a longer time.)

Formula for Impulse

Example: Wall exerts a force of 10,000 N.
The contact time is .001 s. What is the
impulse?

$$\begin{aligned}\text{Impulse} &= F t \\ &= 10 \text{ N-s}\end{aligned}$$

Impulse Changes Momentum

Impulse = The change in momentum

Decreasing Momentum over a long time

For the same change in momentum (moving then stopped),
If the time over which a truck stops is large, the force will be relatively small.

Decreasing Momentum over a short time.

If the time over which a truck stops is small, the force will be relatively large.

Spreading impulse out over a longer time means that the force will be less; either way, the change in momentum of the boxing glove, fist, and arm will be the same.

$F t = \text{change in momentum}$

$F t = \text{change in momentum}$

Check Questions

- A garbage truck and a mini car have a head-on collision.
- Which vehicle experiences the greater force of impact?
- Which experiences the greater impulse?
- Which experiences the greater momentum change?
- Which experiences the greater acceleration?

Conservation of Momentum

The total momentum of an isolated system of objects is conserved regardless of the nature of the forces between the objects.

$$\begin{array}{l} \text{Total Momentum} \\ \text{Before Collision} \end{array} = \begin{array}{l} \text{Total Momentum} \\ \text{After Collision} \end{array}$$

Examples: Conservation of Momentum

1. Consider a fish that swims towards and swallows a small fish at rest. If the large fish swims 1 m/s towards the small fish, what is the velocity of the larger fish immediately after lunch?
2. Suppose the small fish is not at rest, but swims toward the left at a velocity of 4 m/s . What is the velocity of the larger fish immediately after lunch?

Examples: Conservation of Momentum

1. Consider a fish that swims towards and swallows a small fish at rest. If the large fish swims 1 m/s towards the small fish, what is the velocity of the larger fish immediately after lunch?

Examples: Conservation of Momentum

2. Suppose the small fish is not at rest, but swims toward the left at a velocity of 4 m/s. What is the velocity of the larger fish immediately after lunch?

Example 3

Is momentum before equal to momentum after??

Before

Momentum Before

$$v=0$$

$$2\text{ m/s}$$

$$= (0.5\text{ kg})(2\text{ m/s})$$

$$m = 1.0\text{ kg}$$

$$m = 0.5\text{ kg}$$

$$= 1\text{ kg} \cdot \frac{\text{m}}{\text{s}}$$

Momentum After

$$v = 1.5\text{ m/s}$$

$$m = 1.0\text{ kg}$$

$$v = 1\text{ m/s}$$

$$m = 0.5\text{ kg}$$

$$(1.0\text{ kg})(1.5\text{ m/s})$$

$$+ (0.5\text{ kg})(-1\text{ m/s})$$

$$1\text{ kg} \cdot \frac{\text{m}}{\text{s}}$$
